More recently, based on this and other information, Dr. Evans (personal communications and in press) has concluded that the parenchymatic and xeromorphytic stone- 
type are 22 ancient in the angiosperms, even though in some modern species it appears that the anomo-
cyte type has

selected for in the parenchymatic.

Some Siberian specimens of Antennaria fissa are very much like a neglecta, and would pass as that with an eastern US label.
For example, H. Podlouč.
+ L. Yakovlev, Yakonoleve s.n., 7. VII. 61.
Kremsyanskii. 1 pet.
Att Pilgrim Oleszinski.

The densest up to 1 in wide, mostly a bit smaller, thinly pubescent except when young. Unt-awned glabrous.
Plants ca. 1 dm tall, 6-8 leaves in flag, 3-9 plants, 23 T. lemma gradually becoming 14 base
stems 4-3 cm.
Tony Everston Langley
Teacher, 1939 for E. Base

Lomonosova // Verstkhina
1933 - Ture, Mongun
Teigunskii // section
29 VII - 1931, would be
as A. microphylla if it had
been collected in the US.
As would Lomonosova //
Dmitri Danilov
1937, "Teigunskii Assoc.
Examination of a compound slide in specimens of Artemisia distans at

Conclude, one that the
distinctions are not very
sharply between this and
A. undulata; in the unripe
and A. rectiloba, it is
somewhat
samples could pass for
the American spp., if they
had a proper American label.
I do not suggest that these
taxa should be considered, but
only that the distinctions are
real, or likely.
